CODOMAIN OF THE VALUE FUNCTION: SAME AS DOMAIN?

When the Emperor Frederick Barbarossa declared that Paris was worth a mass, he was tacitly assigning an action (the ~~possessing~~ ^{taking} of Paris) a value ^{equivalent to that of} ~~that was~~ another action (humbling himself to the Pope). Likewise, when we buy a merchandise we equate--value-wise--two actions: the spending of a certain amount of money, and the acquiring of a certain item. This suggests defining ~~the~~ ^{every} value function(s) on ~~the~~ ^a set of human actions:

$V: A \longrightarrow A$
